Image Super Resolution Thesis This thesis addresses the problem of image super-resolution from a low resolution image. Spatial resolution of images are restricted by the size of CMOS sensors. Spatial resolution can be increased by increasing no of COMS sensors resulting in decrease in size of CMOS sensors which cause shot noise. Development of Image Super-resolution Algorithms - thesis Image Super Resolution (SR) is an important post-processing technique where multiple input images are super resolved to obtain one or more images of higher resolution and better quality. SR necessitates a good image registration procedure

This thesis addresses the problem of image super-resolution, which is the process by which one or more low-resolution images are processed together to create an image (or set of images) with a higher spatial resolution. Multi-frame image super-resolution refers to the particular case where multiple images of the scene are available. This thesis focuses on one type of super-resolution method, spectral super-resolution. We aim to produce a high-resolution hyperspectral image from a signal RGB observation. Mapping three discrete intensity values to a continuous spectrum is highly under-constrained. Autoencoder based Single Image Super Resolution - GitHub Super-resolution technology can overcome the limitations of the imaging system. It can improve the resolution of the image without changing the existing equipment. It is widely used and has very important theoretical value and practical significance. Super-resolution algorithms, plotted according to the mean reconstruction accuracy (measured by RMSE values) and mean perceptual quality (measured by the recent metric). Current methods group into two clusters: (i) upper-left) high PSNR/SSIM and (ii) lower-right) high perceptual quality. 2018 PIRM Challenge on Perceptual Image Super-resolution the patches of high resolution is obtained by using the dictionary which has high resolution and sparse coefficients of low resolution.
